

From Dr Tim Thornton in response to the debate on setback distances.

The 500 metre set back is an attempt at a compromise distance that aims to protect people from nuisance and harm, balanced with the ability of the gas industry to get on with its job.

If we cannot look abroad for indicators of harms and setbacks then we must be cautious at first with a novel industry – as it is described by DECC. If, as the industry and government expect, it will be clean safe and be of short duration only, then the setback distances may be reduced on reviewing the plan. The industry does not need to drill all its holes in the first few years and 20% access to their territory should be sufficient to keep them occupied for, perhaps, a decade. Should harms be experienced beyond 500 metres then the industry will have to work hard to improve mitigation and perhaps sacrifice some profitability to maintain that setback or, once they have shown a lack of harm, reduce the distance.

While the detail of impacts outside the UK may not be appropriate to discuss, the principle of harm being proportional to exposure levels remains recognised and the levels of exposures are proportional to distance from the source. There is a significant evidence base that impacts on health are proportional to the distance from wells, as well as the number and activity of those wells. Having no distance would therefore be unacceptable.

There have already been instances in England where the Industry has been unable to contain their impacts to the estimated or conditioned limits. Noise exceedences occurred at over 800 metres from the well at Kirby Misperton, let alone the 500 metres that is being proposed. In Lancashire the night noise limit was exceeded for much of a three month period.

Spectrum Acoustic Consultants wrote a noise monitoring plan for Ryedale District Council which was adopted by the Mineral Planners. In it they set limits on noise during the Pre-Stimulation workover and on further activities which did not happen. At 5 Shire Grove where there had been previous complaints during the drilling in 2013, the limits were set at 47dB by day and 36 dB evening and night. The predictions were noise levels to be 31 dB day and night at Shire Grove, and more generally between 31 and 34dB overall. On page 5 there were details of the trigger levels for actions to be taken should the limits be breached. On page 6 the breach responses are clear that NYCC should be informed and if 5dB over the limit than activities thought to cause the exceedences should cease. They recognised that Shire Grove was more critical as it represented a large number of properties in the village.

<https://www.northyorks.gov.uk/sites/default/files/fileroot/Planning%20and%20development/fracking/Noise%20management%20and%20monitoring%20plan.pdf>

A local monitoring group set up in the garden of 5 Shire Grove as there had been complaints and monitoring there before. We spoke several times to the resident

who had complained frequently of noise disturbance during drilling some years earlier. Measurement by google maps confirmed a distance of over 800 metres from the wellhead to the house. The group used an industry standard apparatus to record noise levels and samples of the noise activity.

I refer to the Castle Consulting levels and interpretations, however, I referred to weather data from the WACL York University monitoring set up by the British Geological Survey. They recorded minute by minute wind speeds and direction. (Forwarded the relevant days recordings under separate email system)

Castle Consulting performed the monitoring and interpretation for Third Energy and thence the Environment Agency.

https://consult.environment-agency.gov.uk/onshore-oil-and-gas/third-energy-kirby-misperton-information-page/supporting_documents/Noise%20Prestimulation%20report%20211117%20rev%202.0.pdf

Their report details the breaches at 5 Shire Grove – over 800 metres from the well, an extra 50% further away than is proposed in the MWJP and objected to by Industry. During the 18 days monitoring, 7 days were discarded due to high winds. At Shire Grove during the remaining 11 days there were 15 noise breaches thought to come from the site. A clarifying statement suggested as these were often less than 3dB above the conditioned limit, they would be of relatively low impact.

I attach the somewhat crowded graph for Shire Grove with the predicted night time level of 31 added and the night time level limit of 36dB added. The blue line is the Laeq1hr – the one that is conditioned.

(For reasons of clarity I have attempted to adjust the colour so that the relevant blue graph line is easier to follow. It should dip under the night limit for 11 of 24 hours.)

The tables starting on page 17 for Shire Grove show levels above 36dB which have not been discounted.

Possible breaches are listed on page 21 of the report. Explanation for possible breaches are made on page 121 for Shire Grove.

The overall pattern of the graph and of the data points to difficulties in staying within the permitted limits. This, despite the monitoring taking place behind a tall and thick hedge. It also suggests the original estimates did not reflect the reality of the noise generated during this modest operation. The original drilling was reported to be loud and of a disturbing nature 'like fingernails down a blackboard' at times. I am unaware of monitoring at that time. The actual fracturing never happened but was anticipated to have a 17dB greater noise impact than pre-stimulation workover. Pages 3-5 of Spectrum Management Plan.

I asked both NYCC, the named body to report to, and Ryedale District Council who are usually responsible for noise and having an Environmental Health Officer, and neither reported being alerted to these breaches. On page 119 of the report there was a breach 14/10 to 15/10 which resulted in operations ceasing. I

am writing to these organisations as well as the EA and HSE for details of communications as Third Energy have explained that they had filed details of these breaches.

Third Energy noted the ornamental fountain increased the noise levels when turned on even though it was running constantly. They had been months of background noise data as they awaited the start of operations. The fountain (in reality an aerator for fish) would have been running all that time.

Industry estimates are often considerably lower than the reality. The estimates of gas lost from the system and the contribution to greenhouse gases have been shown to be flawed when compared to direct measurements. Under UK regulations, the North Sea abandoned rigs have been shown to leak methane (and the other gases and chemicals that comprise 'natural gas'). The quantity of gas leaked to air over active rigs and gasfields were estimated to be far lower, sometimes by many magnitudes, than when measured directly by flying over and sampling the actual losses. I am awaiting publication of a paper from the York University Air Chemistry Laboratory (WACL) due for publication in February detailing these significant methane losses to air.

<https://pubs.acs.org/doi/abs/10.1021/acs.est.7b02732>

I feel, therefore, we should be wary of relying wholly on industry estimates for more direct consequences of leaks, spills, venting and flaring in the vicinity of people.

Emergency preparedness close KM8 relies on a North Yorkshire generic emergency plan rather than a rehearsed plan based of scrutiny of the site. There has been no alert system for the community. The main exit route for the thousands of day and night visitors to Flamingo Land is directly towards the well site. How an evacuation would proceed and with what speed should the generic plan be enacted for people and animals remains uncertain.

Ensuring a greater distance from the outset would have been wise as it is unlikely they would move their well thereafter. The reason this has occurred is due to the conventional KMA well being already in place. To drill KM8, the well pad was modified to accommodate an unconventional well, hence the proximity to the village and to Flamingo Land.

We do not know in detail the levels of pollutants that are safe in the short or longer term for children or people with differing conditions. We do not know how the combinations of mental health, physical health, noise light and a variety of pollutants will combine to cause ill health. As we are not permitted to consider evidence from abroad, we are left only with setback distances to protect communities. That and the scrutiny of health before during and after fracking activities to enable the detail of health impacts in our population with our engineering and our regulations. The Precautionary Principle should either rule out hydraulic fracturing on worldwide experience, or impose significant setbacks

and close health monitoring if the process was considered safe in USA or elsewhere. There is no evidence to suggest that our engineering is superior to that of USA where the skills have been learned over a period of 15 years.

There are detailed studies showing ill health in various spheres, which are increased in association with activity and exposures to the wells. There is a formula that takes account of distance from the wells, activity at the wells the number of wells. Results from reliable academics (Senior researchers from Johns Hopkins University, Bloomberg School of Public Health) have shown an association with exposure on the following - Radon levels in the home (2nd leading cause of lung cancer), prematurity, complicated pregnancies, asthma, depression and symptoms of headache, migraine, lethargy and nausea, and a further study demonstrated the association with congenital heart disease. There are pointers from USA to cause thoughtfulness about how we protect our communities.

<https://www.jhsph.edu/news/news-releases/2015/increased-levels-of-radon-in-pennsylvania-homes-correspond-to-onset-of-fracking.html>

<https://ehp.niehs.nih.gov/1306722/>

The Faculty of Public Health of UK considers fracking to be inappropriate in terms of Climate Change and probably Public Health. The delegates of the Pennsylvania Medical Association voted 100% to put a stop to fracking there, based on the experiences of 16,000 of their members over a decade of observing the impacts.

<https://www.pamedsoc.org/detail/article/all-reference-committees>
ref 16 - 206

Evidence of harm in the North Sea and from other more mature gas fields should alert us to the need for some sort of extra protection. The easiest and cheapest protection is to restrict where the drill goes down and where the surface impacts are most concentrated. If it can be shown to be safe at 500 metres (albeit in the very short term in Public Health terms) then the distance might reasonably be reduced. We would then be 'Plan Led' and also employing 'Sound Science used Responsibly'.

Additional comment from the hearings in January

UKOOG Barrister demonstrating his copyright map suggested that 25% (modified to 20% thereafter) of the land would be available to drill. Sampling and experimenting could go ahead in 20% + of the licenced area which could keep them busy until the Plan was reviewed.

The distance for a lateral was said to be limited to 2.5 Km. This is a helpful distance to be aware of, though UKOOG often point to Wytch Farm on the South Coast where they drilled beyond 10 km under the sea.

https://www.slb.com/~media/Files/resources/oilfield_review/ors97/win97/ex_drilling.pdf

In Qatar they have managed a horizontal bore of over 12 km.

<http://www.drillingcontractor.org/continuous-improvements-lead-to-maersk-oil-qatars-longest-horizontal-well-in-the-world-1924>

The UKOOG barrister insisted that a vertical would always be used to sample to formations prior to drilling laterals. The Kirby Misperton well was planned and drilled to include a deviation, in this instance because the well pad already existed. Experienced drillers working on wells in Pennsylvania but controlling the drilling from Texas were astonished that anyone in UK would consider fracking a vertical well.

To understand the industry ambitions it is necessary to consider not only exploratory wells but in addition, how many wells may be rolled out. (INEOS suggested in a tendering process on their website that in a 10km x 10km square there could be 30 wells each with 12-16 laterals making 396 in all. They later withdrew this prediction and no company before or since has given a possible roll-out number. The grid pattern approximates to industry standard around the world. It would allow for maximum recovery of the gas as the PEDL requires.

In addition there are huge structures that are not considered in any detail in the Plan – gas processing plants, gas pumping stations and water cleaning plants (probably reverse osmosis), all which need heavy electricity production and connectivity. All these structures leak gases to air with health and have health and Climate Change consequence.

I heard PNR was said to be 1.5 hectares while the planning application suggested 2.5 hectares.

Development Committee 23/6/2015 item 6

Fylde Borough: application number. LCC/2014/0096

Page 4 Proposed Development.

The proposed development is for the exploration and analysis of shale gas reservoirs within the Bowland Shale formation in the Fylde district of

Lancashire.

The shale gas (also called methane gas or natural gas) is known to be distributed within the shale rock. The total area of the surface works is 7.34ha. In addition lateral drilling and hydraulic fracturing would be undertaken in an underground quadrant which could extend up to a maximum distance of 3km from the centre of the well pad.

Page 5 The size of the development site would be approximately 7.34ha, of which an area of approximately 2.65ha would be for the exploration site (well pad and access track) and an area of approximately 4.69ha for the extended flow test pipeline and the gas grid connection.

Underground Exploratory Works

The maximum extent of the below ground works (for vertical and horizontal drilling and hydraulic fracturing) as projected to the surface would extend to a total area of 562ha in a quadrant shape. The northern extent of the quadrant would be around Wildings Wood located to the north of Junction 4 of the M55 with the eastern extent of the quadrant around the village of Little Plumpton. The southwest extent would run from Humber Wood towards Lower Balham village with the western extent in the vicinity of Whitehill Road, Blackpool.

The Cuadrilla representative suggested that gas would be flared as 'best available technique' You may recall during the discussions in May 2018 it was proposed and accepted that 'green completions' should be the norm. Here the gas is separated from the water on its return up the well and the gas is used for energy or processed for the grid. Flaring is a waste of gas and is an incomplete and potentially harmful and noisy process. It released a variety of toxins to the environment including Particulate Matter and CO₂.

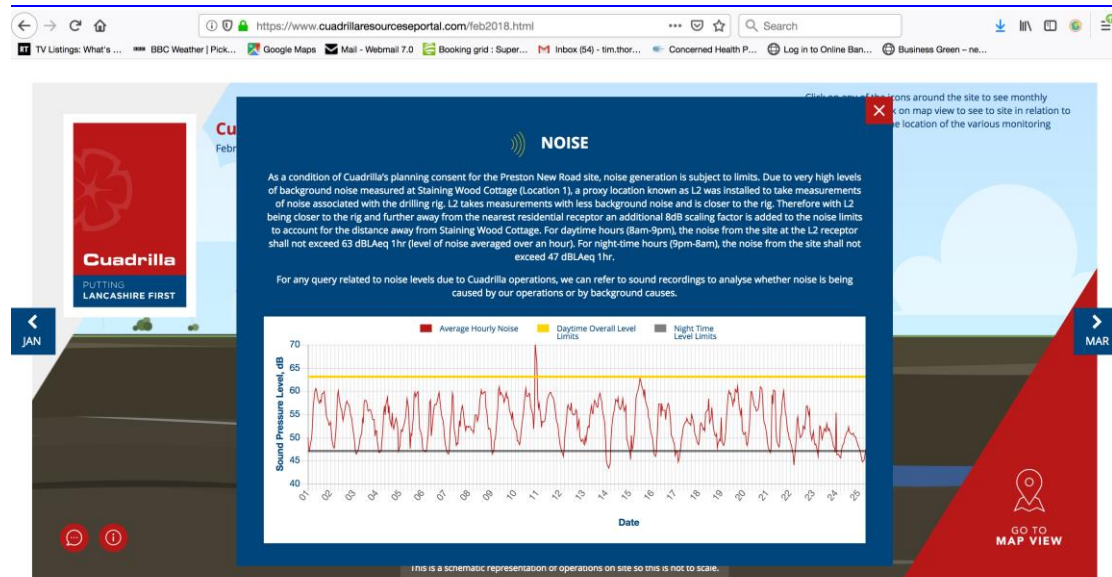

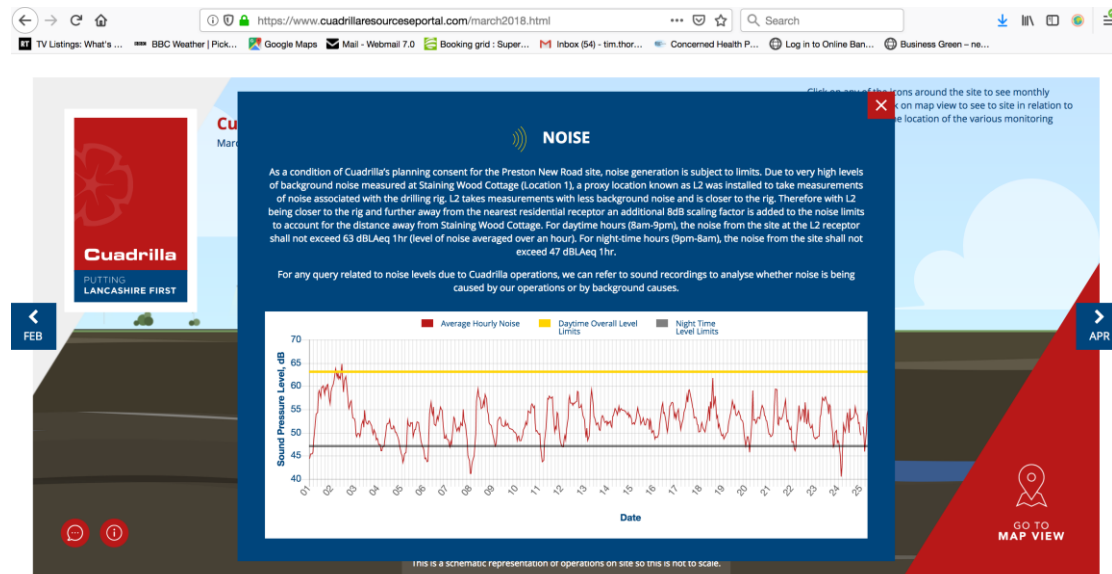

The Cuadrilla representative was unable to be precise about how many wells and how long they may take to drill. Residents are concerned that there may be many verticals and laterals drilled off this large wellsite and so noise emissions, spills leaks and lorries could be a feature of their lives for decades and not just 'a short duration'.

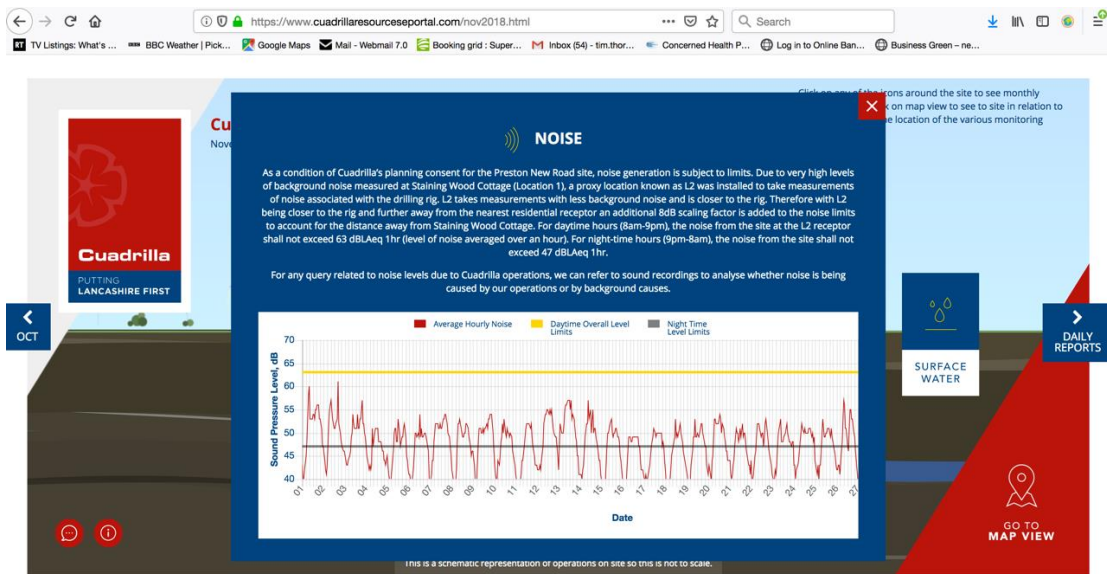

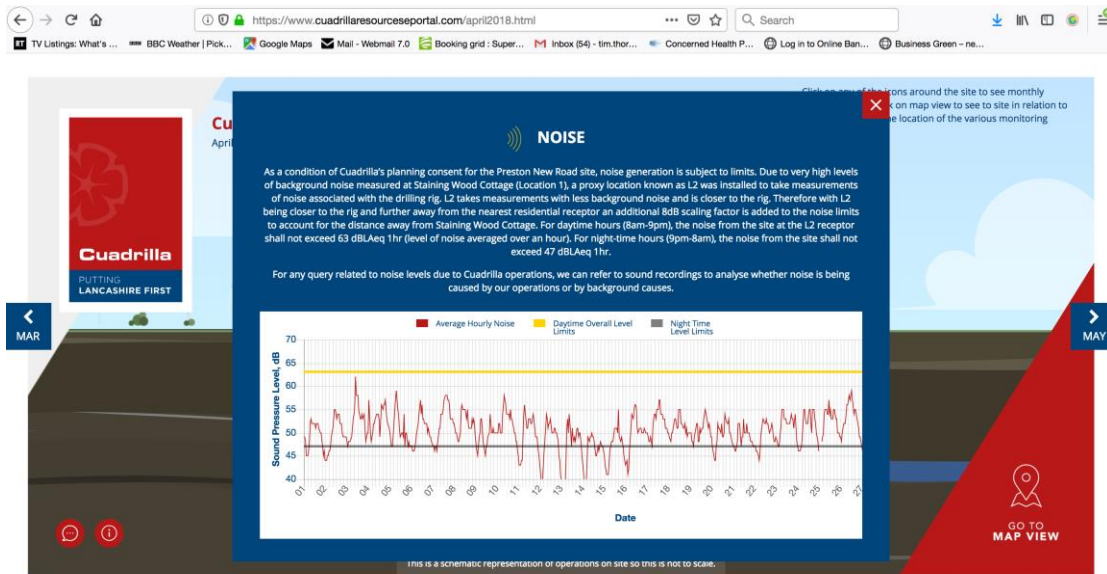

Mr Steele however felt the timescales were irrelevant for the 500 metre setback. Perhaps not so if the drilling were to last for years and the night time limit never be achieved.

Mr Steele described NYCC as being acoustically illiterate. Either I am that also or his client Cuadrilla has failed to convey meaning in their monitoring. It appears

that between February and May the night time maximum level was frequently not achieved. Compare with November. The grey line underneath most of the graph is the night time maximum set at 47dB.

<https://www.cuadrillaresourceportal.com/feb2018.html>

Paul, the noise specialist told of the modifications that could keep noise levels within limits. Despite a company specifying the rigs, compressors etc with mitigation enhancements, the benefits will not be experienced if they are neither available nor used on the site. This, perhaps this could be dealt with under conditioning.

Given that the ambition of a setback is to reduce harmful impacts on people and that the Inverse Square Law probably hold true for gas emissions as well as sound and light, Mr Steel's suggestion that living further than 500 metres from the well will be less protected than at 500 metres is a little odd.

Flaring was suggested as best available practice for dealing with gas returning mixed with water after a frack and thereafter, prior to establishing an adequate pipeline for distribution. Can I suggest best practice is for 'green completions' which we dealt with on a day discussing waste in 2018. You recognised venting and flaring to be damaging to Climate Change and accepted the concept of green completions. I may have overlooked this appearing in the Major Modifications.

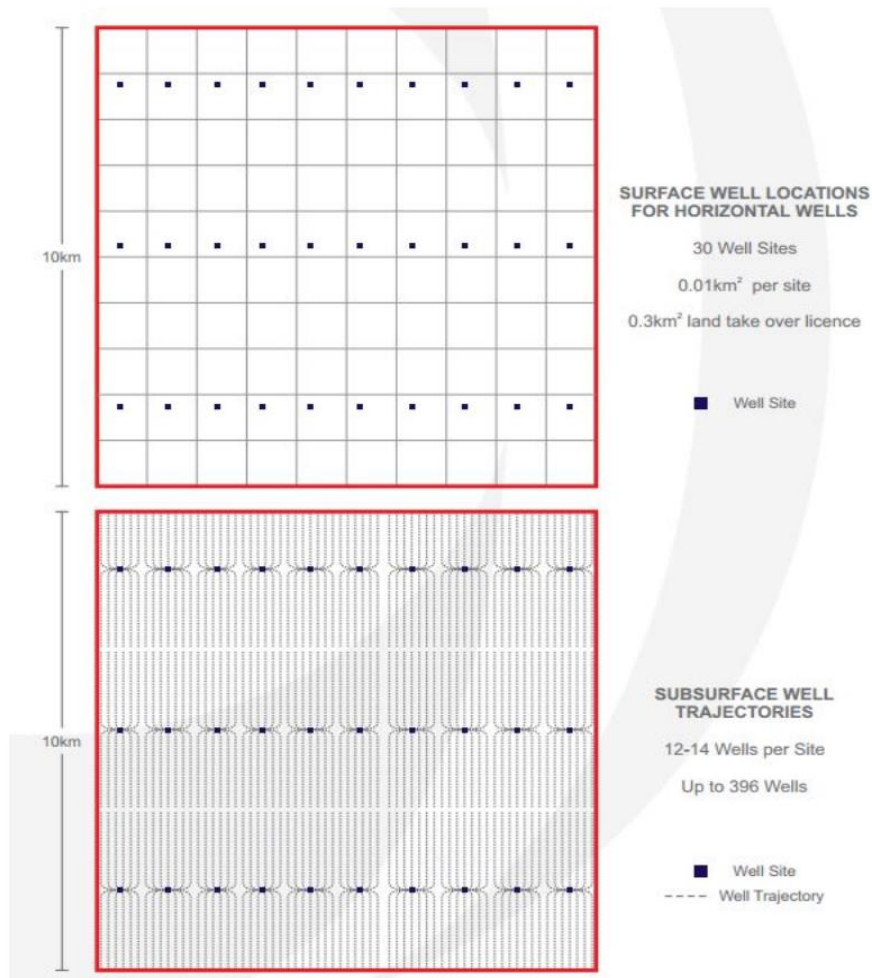

With little experience of fracking in the UK, I think we have sufficient science and evidence to make the case for at least a 500 metre setback distance, as a measure that balances our MP's wish for a one mile setback and the Industry wish for no specified distance.

With kind thanks for your insights and patience throughout the hearings.

Dr Tim Thornton MA MB BChir (Cantab) Retired Family Doctor.
07787 10 20 94

Under INEOS's licence terms published so far, the company has made firm commitments to drill 20 wells in 15 licence areas within five years. Of these wells, 13 would be fracked.

However, online information, currently unavailable, with the tender advert for seismic surveying (see image below) suggests that the company is considering many more wells in each licence area. A licence well density example suggested 30 well sites in a 10km x 10km licence block, with up to 396 horizontal wells.

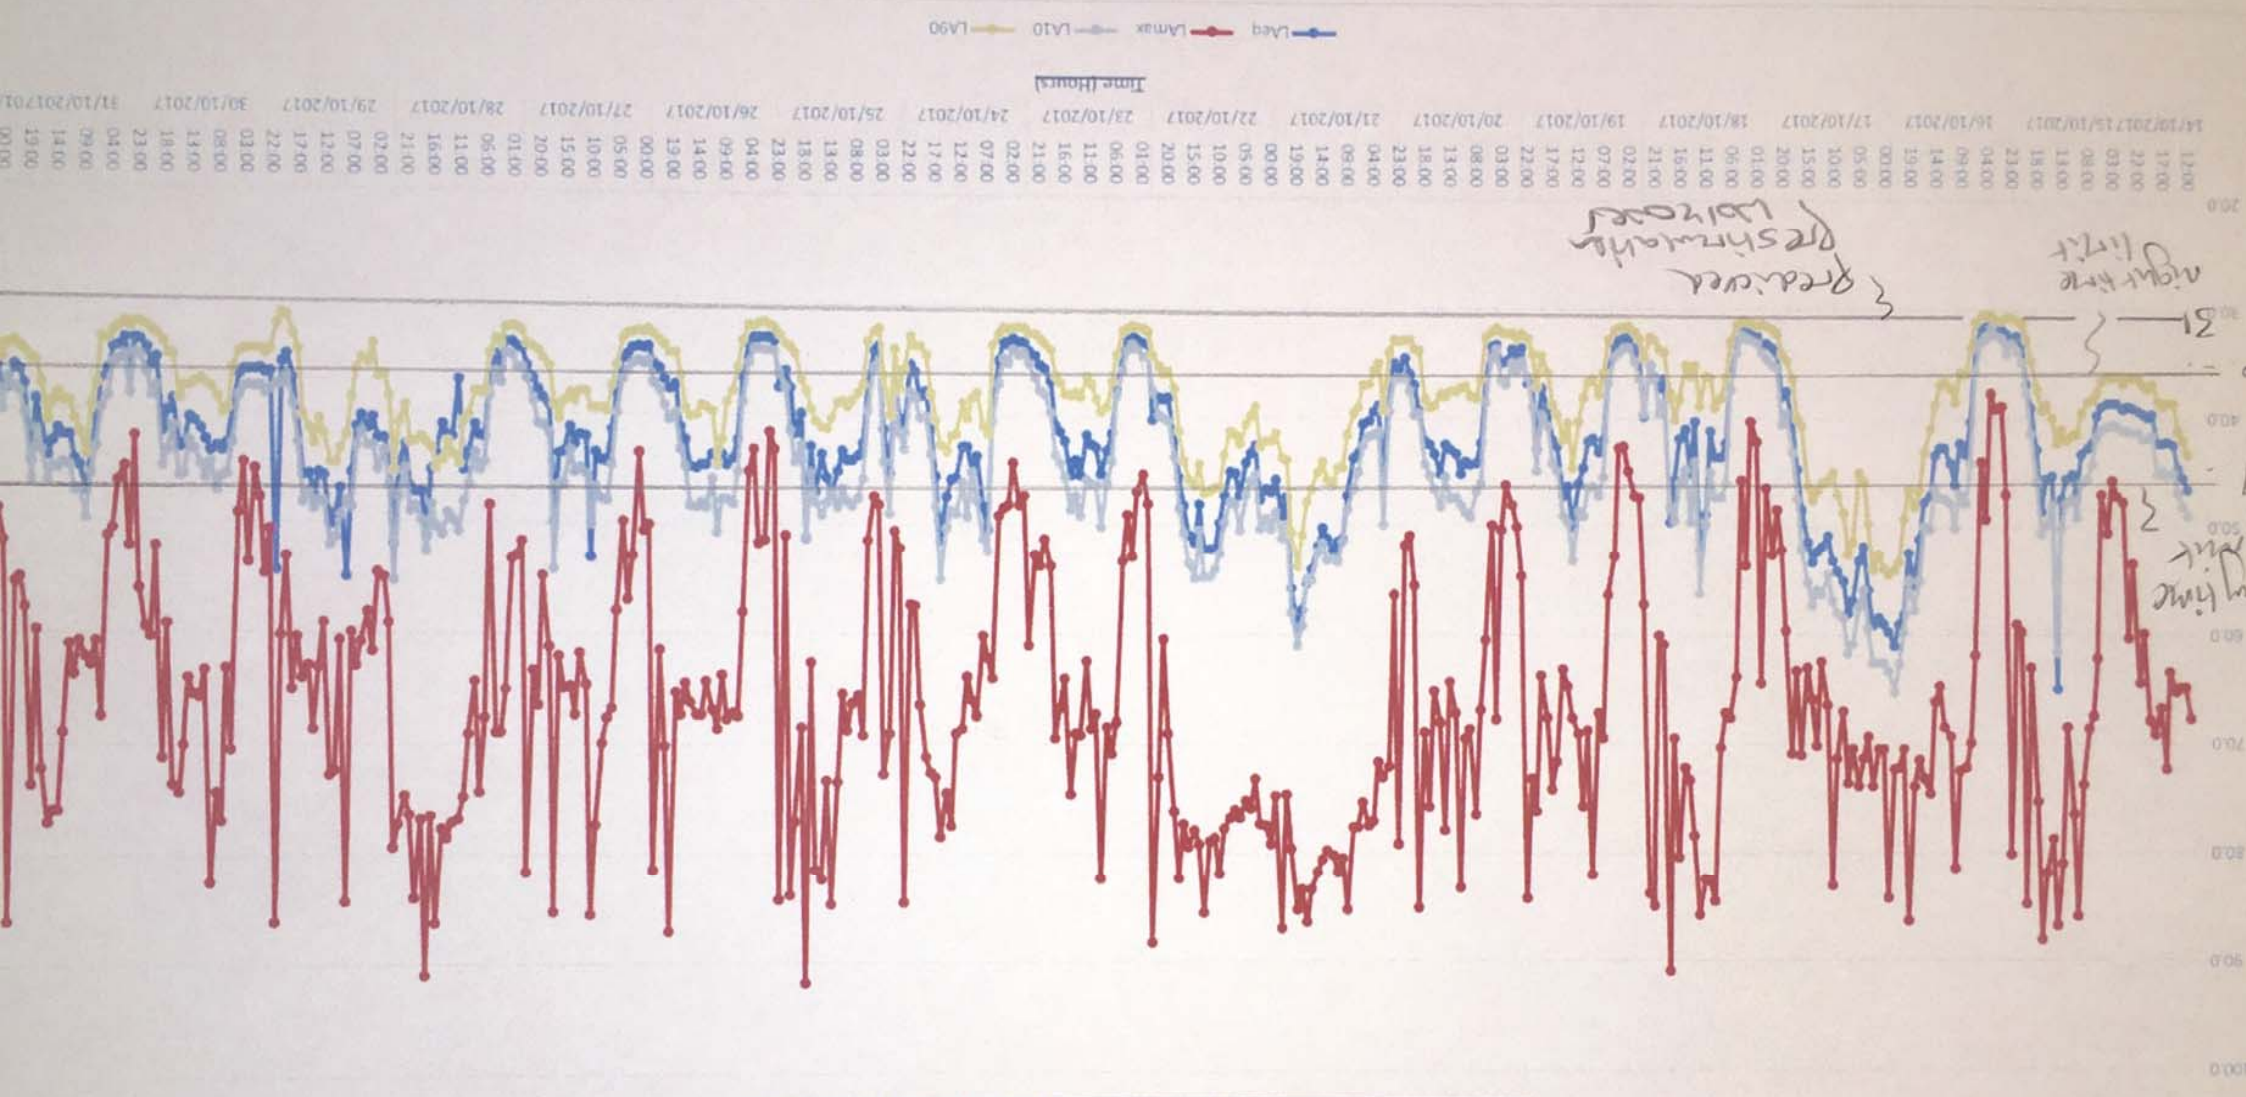

Since publication of this post, an INEOS spokesperson said:

"The graphic and description is wrong and completely our fault. The correct number should be 10 pads with 10-12 wells."
